

Queue Tracker

Real-Time Productivity & Queue Management System

Enterprise-Grade Efficiency & Security

About the Project

Queue Tracker is a production-ready ecosystem designed to solve the complexities of modern team operations. It unifies three critical business pillars:

Real-Time Operations

Live tracking of customer queues and agent availability using WebSocket technology for sub-second synchronization across all users.

Productivity Engine

Granular tracking of INC, TASK, and CALL metrics with historical archiving and performance trend analysis.

Smart Scheduling

Automated Queue Handler (QH) assignments and roster management that respects complex shift patterns and time zones (IST/GMT).

Unified Dashboard

A "Single Source of Truth" that eliminates fragmentation and ensures every team member is aligned with operational goals.

Why it's Successful

- **Zero-Latency Collaboration:** Unlike traditional spreadsheets, Queue Tracker updates instantly. When a manager makes a change, every agent sees it immediately, preventing double-work and confusion.
- **Frictionless User Experience:** Designed with a "Zero-Scroll" philosophy. All critical data—from roster status to productivity counters—is visible on a single plane, reducing cognitive load.
- **Reliability:** Built on a robust Node.js/MongoDB backbone with enterprise-grade session management, ensuring 99.9% uptime and consistent performance during peak traffic.
- **Accountability:** Every action is recorded in an immutable audit log. This creates a culture of transparency where accomplishments are visible and errors are traceable.

Impact & Empowerment

35%

Estimated Reduction in Operational Fragmentation

For Managers

Complete visibility into team performance and the ability to pivot resources in real-time based on live queue volume.

For Agents

Reduces administrative overhead. Agents can focus on resolving tickets rather than manually reporting their numbers.

"Transforming raw data into actionable intelligence, empowering teams to deliver faster and better service."

App Security & Resilience

Security isn't a feature; it's the foundation. Queue Tracker employs a multi-layered defense strategy:

IDENTITY

Two-Factor Auth (2FA)

Mandatory TOTP enrollment for all users. Secure backup codes ensure access even if devices are lost.

ACCESS

Admin Gatekeeping

A strict approval workflow prevents shadow-access. Admins must manually verify and role-assign each new user.

SESSIONS

Active Revocation

Ability to "Kick" active sessions instantly from the admin panel, providing immediate response to compromised accounts.

NETWORK

Traffic Control

Strict CORS policies, CSRF protection, and rate limiting against brute-force and DDoS attempts.

Data Protection & Protection

We treat agent and operational data with the highest level of care:

- **At-Rest Encryption:** Sensitive configuration and 2FA secrets are encrypted using **AES-256-GCM**, the industry standard for secure data storage.
- **Credential Hashing:** Passwords and backup codes are never stored in plain text. We utilize **Bcrypt** with high work factors to resist reverse-engineering.
- **Privacy-First Logging:** Audit logs track actions but scrub Personally Identifiable Information (PII) to ensure agent privacy while maintaining operational transparency.
- **Secure Storage:** Utilizing MongoDB Atlas with strict IP whitelisting and encrypted communication channels (TLS/WSS).

Thank You

The Future of Queue Management is Here.
